MEGHANA GOTETY

gotetym@gmail.com | Atlanta, GA | 404-940-2853 | linkedin.com/in/meghana-gotety | https://github.com/meghanag5 | U.S Citizen

EDUCATION

University of Georgia - Bachelor of Science in Computer Science **Expected Graduation: December 2026**
Relevant Coursework: *Biomedical Image Analysis, Data Structures, Software Engineering, Cybersecurity, Algorithms, Computer Networks*
Certificates: AWS Cloud Practitioner Essentials (In Progress) Data and Programming Foundations of AI (Expected October 2026), Python 3 (Completed July 2025)

TECHNICAL SKILLS

Languages & Tools: Python, JavaScript, TypeScript, Linux, Java, C, C++, SQL, ECL, Git, GitHub, Postman
AI & Data: CNNs, scikit-learn, n8n, TensorFlow, RAG, LlamaIndex, OCR, Embeddings & Semantic Search, Prompt Engineering, Document Intelligence Systems, NLP, Model Benchmarking, NumPy, Pandas
Full Stack: React, Angular, Node.js, Next.js, OAuth2, MongoDB, REST API Design, HTML, CSS, Data Processing Pipelines
Concepts: Machine Learning, Algorithms, Data Structures, Systems Programming, Performance Optimization, Debugging, OOP

WORK EXPERIENCE

Reliance Worldwide Corporation Atlanta, GA
Artificial Intelligence Intern May 2026 - August 2026

- Built an AI-powered document intelligence pipeline using Microsoft Copilot, Power Automate, and REST APIs to extract and process product specification sheet data, reducing manual product comparison workflows by ~40% across ecommerce validation processes.
- Developed and integrated API-driven workflows with Akeneo PIM to structure, manage, and analyze product specification data, improving product data synchronization accuracy between internal systems and ecommerce platforms by ~30%.
- Automated recurring monthly discrepancy reporting in Excel by designing validation pipelines that compare internal company product records against customer-facing ecommerce listings, reducing repetitive manual review efforts by ~50%.
- Collaborated on AI workflow automation initiatives focused on scalable product data management and ecommerce validation, improving operational efficiency and streamlining large-scale product comparison workflows across multiple datasets.

Outamation Remote
Data & AI Engineering Extern October 2025 - May 2026

- Built an end-to-end Python document intelligence pipeline for unstructured mortgage PDFs, handling preprocessing, OCR inference, structured extraction, and semantic retrieval, improving document processing efficiency by ~35% across high-volume workflows.
- Designed a layout-aware blob splitting and routing system to classify and process mixed-document mortgage files at scale, improving document classification accuracy by ~30% and reducing manual intervention in routing workflows.
- Evaluated pipeline scalability across OCR and extraction stages, identifying OCR inference and blob classification as key bottlenecks, then optimized batching and extraction logic to reduce end-to-end processing time by ~25–30%.
- Built and integrated a RAG pipeline using Python + LlamaIndex, comparing Tesseract, PaddleOCR, and EasyOCR for accuracy and latency, improving retrieval precision by ~40% through optimized chunking and metadata filtering.

Fiserv Alpharetta, GA
Software Engineering Intern June 2023 - August 2023

- Built responsive Angular UI components by translating Figma designs into production-ready features using HTML, CSS, and TypeScript, improving internal workflow usability and reducing frontend revision cycles by ~20%.
- Collaborated with designers and engineers in an Agile/Scrum environment to deliver enterprise features, balancing new development with architectural constraints and maintaining consistency across releases.
- Debugged and resolved UI defects across interconnected files and dependencies, improving feature stability by ~25% and reducing recurring frontend issues in production workflows.

PROJECT EXPERIENCE

CRISPR Off-Target Prediction System
Machine Learning and Biomedical AI Project August 2026 - Present

- Developing an explainable machine-learning system to predict CRISPR-Cas9 off-target activity from guide RNA and candidate DNA sequence pairs using sequence encoding, mismatch-position features, and experimentally measured activity data.
- Building and benchmarking baseline and deep-learning models using Python, scikit-learn, and TensorFlow, evaluating performance with precision, recall, F1-score, ROC-AUC, and precision-recall curves.
- Designing an interactive interface that returns an off-target risk score, highlights influential nucleotide positions, and explains the sequence features contributing to each prediction.

Study Spotter
Full-Stack Web Application Project March 2026 - April 2026

- Built a full-stack study space discovery platform using Next.js, TypeScript, MongoDB, Mongoose, and NextAuth, enabling users to search, save, and review study spots with full CRUD functionality across items, reviews, and favorites.
- Designed secure authentication + protected routes with NextAuth session management, integrated the Google Places API, and developed RESTful endpoints for real-time location details, ratings, and reviews.
- Developed responsive frontend features including favorites management, grouped review systems, profile dashboards, and Postman-tested backend routes, improving usability and scalability while reducing manual data handling through efficient full-stack architecture.

UGA Hackathon
LexisNexis Challenge February 2025

- Analyzed and processed approximately 10,000 records using ECL under strict time constraints during a competitive hackathon and placed 2nd.
- Designed and implemented optimized data workflows that improved query performance by 25%, enabling faster insights from large datasets.
